

Envirecover™

Envirecover™, the Product Stewardship program from Enviratile®, aims to reduce the environmental impact of modular carpet tiles in the post-customer phase.

The primary objective of Enviratile®'s Envirecover™ program is to extend the useful life of carpet tiles post-customer through re-purposing and re-using products after their first installation thereby providing a subsequent functionality and a second-life phase.

Working with our Product Stewardship contractor partners, Enviratile® offers our clients the benefit of reclamation of their uplifted installation resulting in maximum resource recovery and re-use and achieving immediate landfill diversion.

Enviratile®'s Envirecover™ program operates in two important situations*:

1. Enviratile® will take back their products at the end of their first life for existing primary clients
2. New customers have the equivalent facility when specifying new Enviratile® modular carpet tiles for their renovation project whereby the company takes back the uplifted uncontaminated carpet tiles regardless of manufacturer.

This offer goes above and beyond the ECS4 and industry requirements, and is offered to our customers, existing and new, at no additional cost.

Enviratile®'s partners will process the used carpet tiles through their stewardship program which consists of re-use, re-selling and ultimately recycling.

Enviratile® has always sought to minimise the environmental impact of their products from cradle to grave, in addition to their impact on the health and wellbeing of people occupying spaces where they are installed.

This is particularly important at a time where we see a continual rise in the turnover and consumption of carpet and other floor coverings.

We are committed to product lifecycle management, and in addition to our efforts to use recycled materials in the manufacturing stage pre-consumer, Enviratile®'s post-consumer Product Stewardship efforts are focussed on achieving practical solutions that are immediately available, effective, and satisfy the criteria of the ACCS ECS Environmental certification scheme and therefore the Green Star system requirements.

Enviratile®'s Envirecover™ solution is specifically designed to comply with the Environmental Certification Scheme Level 4, as administered by the Carpet Institute of Australia.
